

Package ‘RLumModel’

February 20, 2022

Type Package

Title Solving Ordinary Differential Equations to Understand Luminescence

Version 0.2.10

Date 2022-02-20

Author Johannes Friedrich [aut, trl, cre] (<<https://orcid.org/0000-0002-0805-9547>>),
Sebastian Kreutzer [aut, ths] (<<https://orcid.org/0000-0002-0734-2199>>),
Christoph Schmidt [aut, ths] (<<https://orcid.org/0000-0002-2309-3209>>)

Maintainer Johannes Friedrich <johannes.friedrich@posteo.de>

Description A collection of functions to simulate luminescence signals in quartz and Al₂O₃ based on published models.

RLumModel-package	<i>Solving Ordinary Differential Equations to Understand Luminescence</i>
-------------------	---

Description

Details

A collection of function to simulate luminescence signals in the mineral quartz based on published models.

Authors

Johannes Friedrich	University of Bayreuth, Germany
Sebastian Kreutzer	Geography & Earth Sciences, Aberystwyth University, United Kingdom
Christoph Schmidt	University of Bayreuth, Germany

Supervisor

Christoph Schmidt, University of Bayreuth, Germany

.set_pars

Set parameters for Different Quartz Luminescence Models

Description

This function provides all necessary model parameters to the calculation of the ODEs.

Usage

```
.set_pars(model)
```

Arguments

`model` **character (required)**: set model to be used. Available models are: "Bailey2001", "Bailey2002", "Bailey2004", "Pagonis2007", "Pagonis2008", "Friedrich2017", "Friedrich2018", "Peng2022". If model is indeed missing, the list of allowed keywords is returned.

Details

The common model parameters are:

N: concentrations of electron/hole traps in cm^{-3} **E**: depth of the electron/hole trap in eV **s**: frequency factor in s^{-1} **A**: conduction band to electron/hole trap transition probability in s^{-1} **B**: valence band to hole trap transition probability in s^{-1} **Th**: photo-ionisation cross-section in s^{-1} **E_th**: thermal assistance energy in (eV) **n**: concentrations of electron/hole traps after sample history in cm^{-3}

Value

This function returns a [list](#) with all necessary parameters for the used model. Returns vector of allowed keywords if model is missing.

Function version

0.1.3

How to cite

RLumModel: Solving Ordinary Differential Equations to Understand Luminescence. R package version 0.2.10. <https://CRAN.R-project.org/package=RLumModel>

Note

n are the saved concentrations of the last step of the sample history of the used model. They will be loaded, if `simulate_sample_history = FALSE` in `model_LuminescenceSignals` is chosen.

The order of the energy-band-levels is sometimes in a different order than in the original model. This was necessary, because in the simulations the luminescence centre always has to be the last entry in every parameter. Another reason was the clear division between electron traps and hole centres. When a user wants to create his/her own parameter sets he/she only has to take care that the luminescence centre is the last entry in every vector and that the first entries are the electron traps and the last entries the hole centres.

Examples

```
pars <- .set_pars("Bailey2001")
```

`ExampleData.ModelOutput`*Example data (TL curve) simulated with parameter set from Pagonis 2007*

Description

Example data (TL curve) simulated with parameter set from Pagonis 2007

Format

A `RLum.Analysis` object containing one TL curve as `RLum.Data.Curve`.

Function version

0.1.1

Note

This example has only one record (TL). The used sequence was `sequence <- list(IRR = c(temp = 20, dose = 10, DoseRate = 1), TL = c(temp_begin = 20, temp_end = 400, heating_rate = 5))`

Author(s)

Johannes Friedrich, University of Bayreuth (Germany)

Examples

```
data("ExampleData.ModelOutput", envir = environment())

TL_curve <- get_RLum(model.output, recordType = "TL$", drop = FALSE)

##plot TL curve
plot_RLum(TL_curve)

TL_concentrations <- get_RLum(model.output, recordType = "(TL)", drop = FALSE)
plot_RLum(TL_concentrations)
```

model_LuminescenceSignals

Model Luminescence Signals

Description

This function models luminescence signals for quartz based on published physical models. It is possible to simulate TL, (CW-) OSL, RF measurements in an arbitrary sequence. This sequence is defined as a [list](#) of certain aberrations. Furthermore it is possible to load a sequence direct from the Risø Sequence Editor. The output is an [Luminescence::RLum.Analysis](#) object and so the plots are done by the [Luminescence::plot_RLum.Analysis](#) function. If a SAR sequence is simulated the plot output can be disabled and SAR analyse functions can be used.

Usage

```
model_LuminescenceSignals(
  model,
  sequence,
  lab.dose_rate = 1,
  simulate_sample_history = FALSE,
  plot = TRUE,
  verbose = TRUE,
  show_structure = FALSE,
  own_parameters = NULL,
  own_state_parameters = NULL,
  own_start_temperature = NULL,
  ...
)
```

Arguments

model	character (required): set model to be used. Available models are: "Bailey2001", "Bailey2002", "Bailey2004", "Pagonis2007", "Pagonis2008", "Friedrich2017", "Friedrich2018", "Peng2022" and for own models "customized" (or "customised"). Note: When model = "customized"/"customised" is set, the argument own_parameters has to be set.
sequence	list (required): set sequence to model as list or as *.seq file from the Risø sequence editor. To simulate SAR measurements there is an extra option to set the sequence list (cf. details).
lab.dose_rate	numeric (<i>with default</i>): laboratory dose rate in XXX Gy/s for calculating seconds into Gray in the *.seq file.
simulate_sample_history	logical (<i>with default</i>): FALSE (<i>with default</i>): simulation begins at laboratory conditions, TRUE: simulations begins at crystallization process (all levels 0)
plot	logical (<i>with default</i>): Enables or disables plot output
verbose	logical (<i>with default</i>): Verbose mode on/off
show_structure	logical (<i>with default</i>): Shows the structure of the result. Recommended to show record.id to analyse concentrations.

own_parameters [list](#) (with default): This argument allows the user to submit own parameter sets. See details for more information.

own_state_parameters [numeric](#) (with default): Some publications (e.g., Pagonis 2009) offer state parameters. With this argument the user can submit this state parameters. For further details see vignette "RLumModel - Using own parameter sets" and example 3. The parameter also accepts an [Luminescence::RLum.Results](#) object created by [.set_pars](#) as input.

own_start_temperature [numeric](#) (with default): Parameter to control the start temperature (in °C) of a simulation. This parameter takes effect only when 'model = "customized"' is chosen.

... further arguments and graphical parameters passed to [plot.default](#). See details for further information.

Details

Defining a sequence

Arguments	Description	Sub-arguments
TL	thermally stimulated luminescence	'temp begin' (°C), 'temp end' (°C), 'heating rate' (°C/s)
OSL	optically stimulated luminescence	'temp' (°C), 'duration' (s), 'optical_power' (%)
ILL	illumination	'temp' (°C), 'duration' (s), 'optical_power' (%)
LM_OSL	linear modulated OSL	'temp' (°C), 'duration' (s), optional: 'start_power' (%), 'end_power' (%)
RL/RF	radioluminescence	'temp' (°C), 'dose' (Gy), 'dose_rate' (Gy/s)
RF_heating	RF during heating/cooling	'temp begin' (°C), 'temp end' (°C), 'heating rate' (°C/s), 'dose_rate' (Gy/s)
IRR	irradiation	'temp' (°C), 'dose' (Gy), 'dose_rate' (Gy/s)
CH	cutheat	'temp' (°C), optional: 'duration' (s), 'heating_rate' (°C/s)
PH	preheat	'temp' (°C), 'duration' (s), optional: 'heating_rate' (°C/s)
PAUSE	pause	'temp' (°C), 'duration' (s)

Note: 100% illumination power equates to 20 mW/cm²

Own parameters

The [list](#) has to contain the following items:

- N: Concentration of electron- and hole traps (cm⁻³)
- E: Electron/Hole trap depth (eV)
- s: Frequency factor (s⁻¹)
- A: Conduction band to electron trap and valence band to hole trap transition probability (s⁻¹ * cm³). **CAUTION: Not every publication uses the same definition of parameter A and B! See vignette "RLumModel - Usage with own parameter sets" for further details**
- B: Conduction band to hole centre transition probability (s⁻¹ * cm³).
- Th: Photo-eviction constant or photoionisation cross section, respectively
- E_th: Thermal assistance energy (eV)
- k_B: Boltzman constant 8.617e-05 (eV/K)
- W: activation energy 0.64 (eV) (for UV)
- K: 2.8e7 (dimensionless constant)
- model: "customized"

- R (optional): Ionisation rate (pair production rate) equivalent to 1 Gy/s (s^{-1}) * cm^{-3})

For further details see Bailey 2001, Wintle 1975, vignette "RLumModel - Using own parameter sets" and example 3.

Defining a SAR-sequence

Abrivation	Description	examples
RegDose	Dose points of the regenerative cycles (Gy)	c(0, 80, 140, 260, 320, 0, 80)
TestDose	Test dose for the SAR cycles (Gy)	50
PH	Temperature of the preheat (°C)	240
CH	Temperature of the cutheat (°C)	200
OSL_temp	Temperature of OSL read out (°C)	125
OSL_duration	Duration of OSL read out (s)	default: 40
Irr_temp	Temperature of irradiation (°C)	default: 20
PH_duration	Duration of the preheat (s)	default: 10
dose_rate	Dose rate of the laboratory irradiation source (Gy/s)	default: 1
optical_power	Percentage of the full illumination power (%)	default: 90
Irr_2recover	Dose to be recovered in a dose-recovery-test (Gy)	20

Value

This function returns an `Luminescence::RLum.Analysis` object with all TL, (LM-) OSL and RF/RL steps in the sequence. Every entry is an `Luminescence::RLum.Data.Curve` object and can be plotted, analysed etc. with further RLum-functions.

    OSL = c(125, 100, 90),
    PAUSE = c(200, 100),
    TL = c(20, 400, 5),
    RF = c(20, 200, 0.01)
  )

  # call function "model_LuminescenceSignals", set sequence = sequence,
  # model = "Pagonis2008" (palaeodose = 200 Gy) and simulate_sample_history = FALSE (default),
  # because the sample history is not part of the sequence

  model.output <- model_LuminescenceSignals(
    sequence = sequence,
    model = "Pagonis2008"
  )

  ## End(Not run)

```

read_SEQ2R

Parse a Risoe SEQ-file to a sequence neccessary for simulating quartz luminescence

Description

A SEQ-file created by the Risoe Sequence Editor can be imported to simulate the sequence written in the sequence editor.

Usage

```
read_SEQ2R(file, lab.dose_rate = 1, txtProgressBar = TRUE)
```

Arguments

file	character (required): a *.seq file created by the Risoe Sequence Editor
lab.dose_rate	character (with default): set the dose rate of the radiation source in the laboratory Gy/s. Default: 1 Gy/s
txtProgressBar	logical (with default): enables or disables the txtProgressBar for a visuell control of the progress. Default: txtProgressBar = TRUE

Details

Supported versions: Suppored and tested: version 4.36.

Value

This function returns a **list** with the parsed *.seq file and the required steps for `model_LuminescenceSignals`.

Function version

0.1.0

Examples

```
##search "example_SAR_cycle.SEQ" in "extdata" in package "RLumModel"
path <- system.file("extdata", "example_SAR_cycle.SEQ", package="RLumModel")

sequence <- read_SEQ2R(file = path, txtProgressBar = FALSE)
```

trace_ParameterStateEvolution

Trace parameter state evolution

Description

Traces the evolution of the concentrations in the different levels over different simulation steps. For instance, a sequence consisting of one TL and one OSL step has two iterations. For each step the end concentration is extracted. This way, the evolution of the system can be traced throughout a sequence.

Usage

```
trace_ParameterStateEvolution(object, step = NULL, plot = TRUE, ...)
```

Arguments

object	Luminescence::RLum.Analysis (required): input object created by the function model_LuminescenceSignals . The input can be a list of such objects
step	character (<i>optional</i>): filter the input object to pick particular steps, the input is passed to Luminescence::get_RLum
plot	logical (<i>with default</i>): enables/disables plot output
...	optional arguments to be passed to control the plot output. Supported are xlim, xlab, ylab, log, col, type, bg, main, norm (TRUE/FALSE), grid (TRUE/FALSE), step_names (TRUE/FALSE) Where meaningful, parameters can be provided as vectors. Vectors short than the number of plots are recycled.

Value

Returns a plot and [list](#) with [matrix](#) objects of the parameter evolution. If object is a [list](#) the output is a nested [list](#)

Function version

0.1.0
